

Assume you are working as a Data Engineer for azurelib.com. You are tasked to develop a pipeline that should execute a child pipeline but only when a certain condition is met. Which Azure Data Factory activities would you need to use to accomplish this?

☒ If Condition and Execute Pipeline activities.

☐ Lookup and Until activities.

☐ Web and Execute Pipeline activities.

☐ Switch and ForEach activities.

You have a pipeline 'Pipe1' that you want to execute from another pipeline 'Pipe2'. How would you do that?

☐ By using a ForEach activity in 'Pipe2'.

☐ By using an If Condition activity in 'Pipe2'.

☒ By using an Execute Pipeline activity in 'Pipe2'.

☐ By using a Lookup activity in 'Pipe2'.

Is nested if else allowed in ADF pipeline

☐ TRUE

☒ FALSE

If you want to execute an activity only when a certain condition is met, which activity should you use?

☐ Lookup activity.

☐ Until activity.

☒ If Condition activity.

☐ Web activity.

Is nested For each activity allowed in ADF

☐ TRUE

☒ FALSE

You are fetching a dataset using a Lookup activity. You want to use this dataset in a Copy activity. Where would you provide the dataset's name in the Copy activity?

☒ In the 'Source' tab of the activity.

☐ In the 'Sink' tab of the activity.

☐ In the 'General' tab of the activity.

☐ In the 'Settings' tab of the activity.

Consider the following code snippet in ADF: "activities": [{ "name": "LookupActivity", "type": "Lookup", "typeProperties": { "source": { "type": "SqlSource", "sqlReaderQuery": { "value": "@dataset().sqlQuery", "type": "Expression" } } } }] What does this code do?

☒ It executes a SQL query stored in a dataset parameter named 'sqlQuery'.

☐ It copies data from a source to a destination.

☐ It fetches a dataset and makes it available for other activities in the pipeline.

☐ It triggers another pipeline.

What is the main purpose of the Lookup activity in Azure Data Factory?

☐ To copy data from a source to a destination.

☐ To create a data flow.

☒ To fetch a dataset and make it available for other activities in the pipeline.

☐ To execute a SQL query against a database.

Assume you are working as a Data Engineer for azurelib.com. Your team uses a Data Factory pipeline which fetches a dataset from a database using a SQL query. This query should be configurable so that it can be easily adjusted in the future. How would you implement this functionality in the pipeline?

☒ By creating a parameter in the dataset that the SQL query uses and storing the SQL query in this parameter.

☐ By creating a variable in the pipeline and storing the SQL query in this variable.

☐ By storing the SQL query in the linked service that the dataset uses.

☐ By storing the SQL query in the source of the Copy activity.

You are using the Lookup activity to fetch a dataset from a source. Can this dataset be used in subsequent activities in the same pipeline?

☐ Yes, but only in the activity that follows the Lookup activity.

☒ Yes, it can be used in any activity within the same pipeline.

☐ No, it cannot be used in any other activity.

☐ Yes, but only in a Copy activity.
